

## ABSTRACT OF THE DISCLOSURE

A method of manufacturing a ceramic film includes providing a treatment target in which a raw material body including a complex oxide is applied to a substrate, and  
5 crystallizing the raw material body by holding the treatment target in a chamber and  
subjecting the treatment target to a heat treatment at a predetermined pressure in a gas  
which is pressurized at two atmospheres or more and includes at least an oxidizing gas.  
The gas is supplied to the chamber after being heated to a predetermined temperature in  
advance.
